

User manual:

- The source code of the Helloworld module is in the directory:
`\LamChiThanhCVWOassign2finalSubmission\drupal_root\sites\all\modules\drupal7_common_modules\helloworld_d7`
- You can access the URL: chithanh.tk for a working online website.
- Log in with the username “zevergreenz” and password “123456”.
- After logging in, you can see the “Helloworld” module, with a mass user import tab.
- Type in the users in the correct format (one user on a line, name and email separated with a colon). You can also add comment (option) for all the users.

Personal experience: This is the first time I use a framework to develop website. I can understand when I read the code but I have not thoroughly know what exactly happening. I read the Drupal book about the flow of execution but I am still not clear about it. Drupal is also very convenient as it has a lot of contributed modules. While I was installing the Helloworld module, there is one missing module that required for Helloworld. Then I can just download it from Drupal online resources then I can install the Helloworld module. After the assignment, I have a general idea what is a framework, how can it help us in developing our website.
